ePrescribing

ePrescribing – This robust functionality streamlines the process for generating prescriptions, keeps an up-to-date profile of medications prescribed to patients, and is fully-compliant with CMS program requirements. Patient medication history is captured from Surescripts $^{®}$, formulary information is displayed based on eligibility, and drug-to-drug and drug-to-allergy checks are performed. SRS also offers a certified Electronic Prescribing of Controlled Substances (EPCS) *(http://srssoft.com/epcs)* solution.

- An extensive drug database consisting of over 100,000 drug products is updated quarterly.

- A "Favorites" list of drugs can be customized for each physician.

- One click routes prescriptions to the pharmacy through sureScripts clearinghouse and documents the transaction.

- Patient drug profiles are maintained to track adverse reactions and discontinued medications.

- Prescription messaging with the patient's chart attached facilitates prescribing, hand-off, workflow management, and tracking/documenting.

- Prescription renewal requests are imported directly into the system from pharmacies and automatically delivered to the messaging inbox of the physician or medical staff.
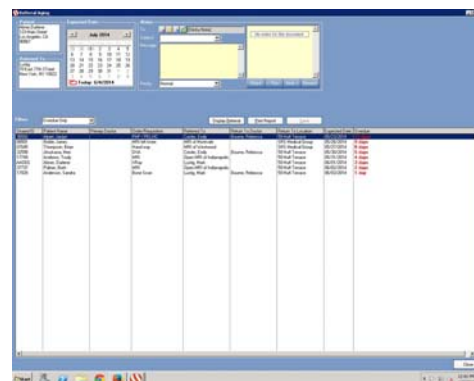

Benefits:

- **Greater efficiency** – automates prescription writing and expedites handling of renewals, dramatically reducing the number of patient calls and time spent by physicians and staff

- **Enhanced quality of care** – access to chart notes and complex prescription histories enhances decision-making, while drug-to-drug identification reduces potential for errors

- **Improved malpractice risk profile** – provides after-hours access to patient charts, legible prescriptions, and complete documentation and tracking

(http://srssoft.com/assets/images/EHR%20Capabilities /ePrescribing_v9 Rx 2.jpg)

- **Greater patient satisfaction** – increases convenience, with no waiting at the pharmacy

- **Global view of patient medication history** – displays medication history from current third-party payers

- **Report generation** – provides prescription snapshot per patient, prescription activity, and custom reports
